

## **In-class Activity 13: Convert an Ajax application from XML to JSON**

The goal of this activity is to modify the Ajax application so it uses a JSON file instead of an XML file. The web page for this application should be the same as it is when the XML file is used.

### **Part 0: Download files**

1. Download **xml\_to\_json\_Activity13.zip** folder and unzip the folder
2. Verify there are no errors in the HTML and CSS files.
3. Rename the files to ***Lastname1Lastname2-Activity13.html***, ***Lastname1Lastname2-Activity13.css*** and ***Lastname1Lastname2-Activity13.js***.
4. You'll also find a file named **team.json** that you should use for the Ajax request instead of the file named **team.xml**.
5. Review the code and make sure you understand the code. Run the application to see how it works by clicking on each tab.

### **Part 1: Modify code**

1. Modify the `$.ajax()` method that gets the data from the XML file so it gets the data from the JSON file.
2. Verify there are no errors.

**Part 2: Upload ALL files and folders to you and your partner's public\_html folder and verify the URL.**

---

**Web-Based Application Design and Development (ITIS 3135)**

**Part 3: Turn in your activity**

1. Each partner should upload the *.html*, *.css* and *.js* files to Canvas, and place in the Comments their URL and partner's name.
